1. FLAKY_TESTS

- **redirects to dashboard after successful login:** Flake hypothesis: Intermittent navigation timeout, possibly due to parallel worker contention or temporary network delay causing `page.waitForURL` to exceed the default 60s timeout. It passed in Build 2, confirming non-deterministic behaviour.

2. CONSISTENT_FAILURES

- **rejects login with expired session token:** Same assertion failure in both builds – Expected HTTP 401, received 500. Probable root cause: Backend throws an unhandled exception (500) when processing an expired token instead of returning the proper 401 status. Likely a server-side bug requiring a code fix or an API contract update.
- **renders revenue chart with correct totals:** Both builds assert `$48,250` but get `$0`. Probable root cause: Revenue data is not being loaded or calculated correctly; could be missing test data setup, a regression in the revenue API, or a frontend rendering defect. This is a reproducible, real bug.

3. RERUN_RECOMMENDATION

- **Rerun (flaky):** «redirects to dashboard after successful login» – re-execute to determine persistency; if flaky, consider quarantining and adding retries or improving wait strategies. No immediate code change required.
- **Send to engineering (bugs):** «rejects login with expired session token» and «renders revenue chart with correct totals» – both are deterministic failures needing investigation by the development team (backend / data / frontend).

4. SUMMARY

- **Counts:** 50 total tests, 47 passed consistently in both builds, 2 consistent failures, 1 flaky.
- **Suite health:** Moderately healthy. The majority of tests are stable, but two reproducible failures point to real defects, and one flaky test indicates a need for improved test robustness. Action is required to address the consistent failures before the suite can be considered reliable.
